Questions

<i>Structure</i>		<i>Permutation Group</i>
A	\rightarrow	$\text{Aut}(A)$ on A
$\text{Inv}(G)$	\leftarrow	G on A

$$\text{Inv}(G) = \bigcup A^n / G.$$

$L_k: A^k / G$ (k -types) *language*

- k -closed: $G = \text{Aut}(L_k)$
- k -homogeneous: A^ℓ -orbits are determined by L_k -isomorphism, all ℓ .

k -homogeneous $\implies G^X$ k -closed, all subsets X .

Example: Petersen Graph

The Relational

Definition

Examples

Issues

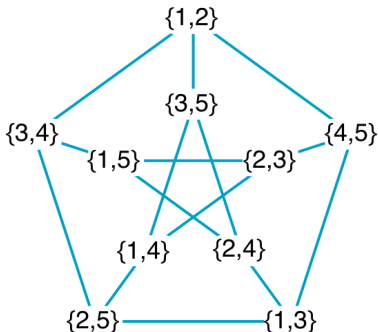

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

(Gardiner, Sheehan)

$$m \cdot K_n \quad C_5 \quad (D_{2.5}) \quad [3]^2 \quad (\text{Sym}_3 \wr \text{Sym}_2)$$

What about C_n ?

Metrically homogeneous, complexity 2, but $|A^2/G| \rightarrow \infty$.

(Bounded complexity, unbounded language)

What about $[n]^2$?

For $n \geq 4$: relational complexity is 4. (Edges \parallel or \perp)

Relational complexity spectrum: $[2, 4]$ (mind the gap).

Relational complexity spectrum

Combinatorics

Group Theory

Questions

$\mathbf{a} \stackrel{r-1}{\sim} \mathbf{a}'$; $\mathbf{a} \not\sim \mathbf{a}'$; length r .

W.l.o.g. \mathbf{a}, \mathbf{a}' agree on $r - 1$ entries

(a_1, \dots, a_{r-1}, a)

$(a_1, \dots, a_{r-1}, a')$

Example $(GL(n, q), q > 2)$

(v_1, \dots, v_n, v) and (v_1, \dots, v_n, v') basis and two linear combinations with non-zero coefficients.

Relational complexity $n + 1$.

Example: $AO(n, F)$ anisotropic

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Affine space with an anisotropic quadratic form

Relational complexity 2

$$Q(x_i - x_j) \text{ all } i, j$$

$$|A^{(2)}/G| = q - 1 \text{ (edge colors)}$$

$$AO^-(2, 3) = [3]^2$$

$$AO^-(2, 4) = \text{“Gleason graph”}$$

Some issues

The Relational Complexity of a Finite Permutation Group

Gregory Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

- Bounded relational complexity \implies ??
- Compute or estimate relational complexity for “natural” actions
- Meaning of gaps in the relational complexity spectrum.
- Determine a canonical language.

Relational complexity 2

The Relational Complexity of a Finite Permutation Group

Gregory Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Conjecture

If G is binary and primitive then it is one of the following.

- $\mathbb{Z}/p\mathbb{Z}$ acting regularly
- $AO(n, q)$ anisotropic (so $n \leq 2$)
- $\text{Sym}(n)$, acting naturally.

Ch., Wiscons: reduction to almost simple case

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Stabilizer height:

Breadth of the lattice of pointwise stabilizers; $\min r$ so that

any G_A is $G_{A'}$ for some $A' \subseteq A$, $|A'| \leq r$

Nondegenerate sequence:

Independent point stabilizers (e.g., minimal base).

Stabilizer height tends to be maximal size of **minimal base**.

Some exceptions:

$\text{PFU}(3, 4)$ in degree 65, $3^4 : 16$, or J_2 on Hall-Janko graph

Relational complexity is bounded by stabilizer height plus 1
(so orbit tree search terminates)

Example (Revisited)

$\text{GL}_n(q)$: stabilizer height n , relational complexity $n + 1$
unless $q = 2$.

More upper bounds

- For a finite abelian group A , the maximal relational complexity in any action is $\text{rank}(A)+1$.
- For $H \triangleleft G$ with abelian quotient, the relational complexity is bounded by

$$\text{Stabilizer height of } H + \text{rank of } G/H + 1$$

Example

The relational complexity of $\text{AGL}(n, q)$ is at most $n + 3$

Hence for $q > 2$, it is $n + 2$ or $n + 3$.

Problem

When does $\text{AGL}_1(q)$ have relational complexity 3? 4?

Action on k -sets

The Relational
Complexity of
a Finite
Permutation
Group

Gregory

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Example

Stabilizer height of Sym_n on k -sets

$$n - 1 \quad (k = 1)$$

$$n - 2 \quad (k = 2 \text{ or } n = 2k + 2)$$

$$n - 3 \quad (k \geq 3, n \neq 2k + 2)$$

Relational complexity

- Sym_n : $\lfloor \log_2 k \rfloor + 2$
- Alt_n : **stabilizer height** of Sym_n .

Relational spectra: Sym_n : Interval $[2, \text{r.c.}]$

Alt_n : $[2, \text{r.c.}_{\text{Sym}}] \cup [h_{\text{Sym}, \min}, h_{\text{Sym}, \max}]$ (?)

E.g. Alt_{11} , $k = 3$: $[2, 3] \cup [5, 8]$

Partitions

The Relational
Complexity of
a Finite
Permutation
Group

Gregory
Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

- The relational complexity of Sym_{2n} on shape $n \times 2$ is n .
The relational complexity of Alt_{2n} on shape $n \times 2$ is similar:
 $n - 1$, n , or (for $n = 3$) $n + 1$

Problem

Estimate the relational complexity of Sym_{nk} on shape $n \times k$, in particular shape $2 \times k$.

The “geometric height” (breadth of the lattice generated by the partitions of shape $n \times k$) is known.

Problem

Is the stabilizer height of Sym_{nk} on $n \times k$ typically equal to this “geometric height?”

Binary almost simple actions

The Relational
Complexity of
a Finite
Permutation
Group

Gregory
Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Conjecture

A binary primitive action with simple socle is Sym_n acting naturally.

Alternating socle handled by Gill and Spiga.
Eliminate the rest?

- Case study: Socle = Monster (Dalla Volta, Gill, Spiga)
(my understanding of the analysis)
44 known maximal subgroups up to conjugacy; any others
have socle $L_2(13)$ or $L_2(16)$.

Elementary abelian groups

The Relational
Complexity of
a Finite
Permutation
Group

Gregory
Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Fact (Gill et al.)

If a binary group contains an elementary abelian p -subgroup $A = \langle a, b \rangle$ of rank 2 with a, b, ab all conjugate, and a fixes a point α , then the order of G_α is divisible by p^2 .

Removes 28 of the 44 maximal subgroups, and the two doubtful socles. (Primes 5, 7, 11.)

Suborbit divisors

The Relational
Complexity of
a Finite
Permutation
Group

Gregory
Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

Remark

Let G be a binary group on Ω .

Suppose that (almost) every transitive binary action of the point stabilizer has degree divisible by the prime p . Then p divides $|\Omega| - 1$.

With a great deal of computation (Spiga) **inside the point stabilizers**, this eliminates 13 more, leaving:

$$\begin{array}{l} \#9. \quad S_3 \times Th \\ \#15. \quad 3^{3+2+6+6} : (L_3(3) \times SD_{16}) \\ \#19. \quad 5^{3+3} \cdot (2 \times L_3(5)) \end{array}$$

The holdouts

The Relational
Complexity of
a Finite
Permutation
Group

Gregory
Cherlin

Definition

Examples

Issues

The minimal case

Upper bounds

Combinatorics

Group Theory

Questions

$$\begin{aligned} \#9. & \quad S_3 \times Th \\ \#15. & \quad 3^{3+2+6+6} : (L_3(3) \times SD_{16}) \\ \#19. & \quad 5^{3+3} \cdot (2 \times L_3(5)) \end{aligned}$$

Examine suborbits, using structural information rather than computation

E.g. $M = S_3 \times Th$:

$$M = N(\langle a \rangle) \text{ (order 3)}$$

$$N_{Th}(b) = (3 \times G_2(3)) : 2 \text{ (maximal, } |b| = 3, b \in Th)$$

$$a^g = ab$$

$$M \cap M^g = N_M(ab) = \langle a \rangle \times N_{Th}(b)$$

Orbit of M on Mg permutation isomorphic to primitive action of Th ; contradiction.

Some Group Theoretic Questions

The Relational
